# ACKNOWLEDGEMENTS

The authors would like to thank the Walton Family Foundation for its support of this project. We would like to thank James Lanich, Dave Johnston and the Educational Results Partnership for providing the data for the schools analysis. Also, we would like to thank the Texas Public Policy Foundation for its partnership with the Pacific Research Institute (PRI) on this study. Dr. John Merrifield of the University of Texas at San Antonio peer-reviewed the draft of this study. Any errors or omissions are the sole responsibility of the authors. The authors would like to thank PRI summer intern James Cunningham for his important research-gathering efforts. In addition, the authors would like to thank graphic designer Dana Beigel for her excellent layout of this study. Finally, the authors would like to acknowledge the contributions of the dedicated staff of the PRI, including Rowena Itchon, vice president of marketing, Christine Hughes, vice president, and Sally Pipes, president and CEO. In addition, the authors would like to acknowledge the efforts of Chrissie Dong, formerly a member of PRI's development department, and Laura Dannerbeck, marketing consultant for PRI. The authors of this study have worked independently and their views and conclusions do not necessarily represent those of the board, supporters, or staff of PRI.

# EXECUTIVE SUMMARY

Are regular Texas public schools with predominantly non-low-income student populations performing well? Lots of parents of children at these schools think so. Yet, based on a variety of indicators, many of these schools may not be as good as parents think they are.

On National Assessment for Educational Progress (NAEP), often referred to as the nation's report card, many non-low-income Texas students fail to perform at the targeted proficient level:

- On the 2013 NAEP fourth-grade reading test, 53 percent of non-low-income Texas test-takers failed to score at proficient level.
- On the NAEP fourth-grade math test, 37 percent of non-low-income Texas students failed to score at the proficient level.
- On the 2013 NAEP eighth-grade reading exam, 54 percent of non-low-income Texas test-takers failed to score at the proficient level.
- On the NAEP eighth-grade math exam, 47 percent of non-low-income Texas test-takers failed to score at the proficient level.

*Texas 8th-Grade NAEP Non-Proficiency Rates  
(Non-Low-Income Students)*

Non-low-income Texas students also have lower proficiency rates on the NAEP compared to similar students in other states such as Massachusetts.

The state-administered exam in Texas is the State of Texas Assessments of Academic Readiness (STAAR). The number of questions that a student must answer correctly in order to be deemed proficient on the STAAR exam is a moving target, with higher benchmarks for proficiency being phased in over time until a final “Recommended” level is set. According to *The Dallas Morning News*:

A seventh-grader, for example, needed to get 22 questions out of 52 correct on [the 2014] math test to pass under Phase 1. To pass under Phase 2 would have required getting 30 questions right. And a recommended passing score would have required 37 correct answers.

Passing levels for other tests would change by roughly comparable numbers

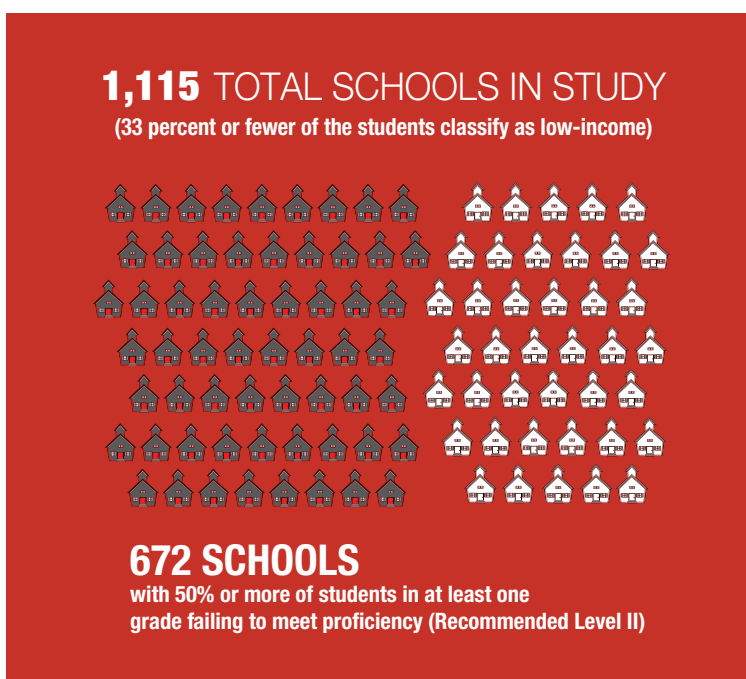

In view of the low Phase 1 cut-point benchmark, and given that Texas says that the Recommended standard in the final phase is the state's goal, this paper will compare the performance of predominantly non-low-income schools using both Phase 1 and Recommended standards, emphasizing the performance of schools under the final Recommended standards.

This study focuses on regular public schools where 33 percent or fewer of their students on the National School Lunch Program (NSLP) and 50 percent or more of students in at least one grade level that failed to achieve proficiency on the STAAR exam. In view of the inflated proficiency rates on the STAAR exam under Phase 1's Level II proficiency cut points, it is not surprising that relatively few schools have 50 percent or more of their students in at least one grade level failing to reach proficiency on one subject matter test. However, if one uses the final Recommended cut points, which the state says are the final recommended benchmarks, then significant numbers of schools fall in the 33/50 category.

In Texas, there are 1,115 regular public schools where 33 percent or fewer of their students classified as low income, i.e. schools with predominantly non-low-income student populations. Among these schools, 672, or 60 percent, have 50 percent or more of their students in at least one grade level failing to meet or exceed proficiency on the STAAR, based on the final Recommended benchmark of proficiency. Among this group are such schools as:

- Cottonwood Creek Elementary School in Dallas County
- Garden Ridge Elementary School in Comal County
- Shady Grove Elementary School in Tarrant County
- Salado High School in Bell County
- Liberty Elementary School in Denton County

A technique called linear regression-line modeling was used to estimate whether a relationship exists between the percentage of students in a school who are classified as coming from low-income households and the percent of students proficient (at grade level) in the school for a particular grade and subject. This analysis for each grade in reading and math allows for the identification of schools that are performing above or below average performance based on the performance of all other schools in the state.

Schools on the regression line itself are performing at the average given the performance of all other schools in the state and the income levels of students, based on low-income and non-low-income classifications. Schools below the regression line are performing below average given the income status of their students, while schools above the regression line are performing above average given the income status of their students.

Among the 1,115 regular public schools that have less than 33 percent of their students coming from low-income households, 758 have at least one grade where the subject-matter proficiency rate, based on the final Recommended benchmark of proficiency, was below the regression line. In other words, 68 percent of these predominantly non-low-income schools had at least one grade where students performed below the average performance of schools with the students of the same income status on a subject-matter test. The following is the breakdown of the number of under-performing predominantly non-low-income regular public schools per grade level for reading and math:

Grade	Number of Schools Underperforming in Reading	Number of Schools Underperforming in Math
3	248	258
4	265	243
5	245	224
6	112	112
7	100	101
8	99	106
9-12	36	122

*Source: Educational Results Partnership*

Of course, there is some overlap in the bulleted totals, with some schools listed more than once since they may have multiple grades and/or subjects below the regression line particular to the grade-level subject-matter test. Among the 758 schools not performing up to expectations:

- Elliott Elementary School in Collin County
- Haslet Elementary School in Denton County
- Sandra Mossman Elementary School in Galveston County
- Laura Negley Elementary School in Hays County
- Lumberton High School in Hardin County

These results should cause non-low-income Texas parents, many of whom are middle class, to rethink their views on the quality of their neighborhood public schools, and, consequently, to open their minds to other education options, choices and policy changes that would allow their children to escape under-performing schools and attend better-performing alternatives. Among these alternatives are a variety of school-choice programs:

- Indiana and other jurisdictions make school-choice vouchers available to non-low-income parents and their children.
- Former Harvard law professor and current U.S. Senator Elizabeth Warren (D-Massachusetts), who has co-authored an influential book on the challenges facing the middle-class, recommended, “A well-designed voucher program would fit the bill neatly.”

Recent polling in Texas shows that a large majority of Texas voters, 66 percent, support school-choice vouchers. A large majority also agreed that education in Texas is on the “wrong track,” and 54 percent labeled the state’s public school system as only “fair” or “poor.”

Texas lawmakers have failed to pass significant school-choice legislation that addresses the overwhelming preferences of state voters. As one Texas parent complained, “My kids need options now, not in two or four more years.” It is time for Texas leaders to heed such pleas.

# Introduction and Background on “Not as Good as You Think” Research

In 2007, the Pacific Research Institute (PRI) published a landmark book entitled *Not as Good as You Think: Why the Middle Class Needs School Choice*. The book examined student performance on California math and English exams in the state’s public schools that had relatively few low-income students. The book found that hundreds of these public schools were underperforming based on the California Standards Test (CST). In 2009, PRI published a follow-up study entitled “Still Not as Good as You Think: Why the Middle Class Needs School Choice.” This current study examines schools with similar student populations in Texas to discover whether the same underperformance phenomenon is occurring.

In the 2007 PRI book, the authors examined the pool of schools in California where a third or fewer of the students at the school were eligible for the National School Lunch Program (NSLP), which is the federal program that provides free or reduced-priced lunches to students. Participation in the NSLP program is often used as an indicator of low-income family background. Children from families with incomes at or below 130 percent of the poverty level are eligible for free meals, and those from families with incomes between 130 percent and 185 percent of the poverty level are eligible for reduced-price meals. If only a third or fewer of the students at a school were eligible for the NSLP program, one could reasonably conclude that the school was attended predominantly by non-low-income or non-economically-disadvantaged students.

Using the benchmark of one-third or fewer students eligible for the NSLP was actually a very conservative categorization. For example, a study by the Third Way research think tank attempted to examine the student achievement at middle-class public schools around the country. The study used a broad definition of “middle class”: “Those with between 26 percent and 75 percent eligibility [for the NSLP] represent our target middle-class schools.”<sup>1</sup> The study’s authors, however, acknowledged some problems with the wide net that they cast: “There are some characteristics in which the schools with 51-75 percent of their student population eligible for the NSLP look more like lower-income schools than middle-class schools.”<sup>2</sup> Given such an admission, conservatively defining middle-class or non-low-income schools seems prudent.

Within the pool of public schools with one-third or fewer students on the NSLP program, PRI’s 2007 book then examined the performance on the state-standards-aligned California Standards Test (CST) in mathematics and English. California had set grading benchmarks of advanced, proficient, basic, below basic, and far below basic. It was the state’s goal that all students score at least at the proficient level on the CST. The authors then reviewed the test results from the pool of predominantly non-low-income schools and determined how many schools had more than 50 percent of students performing below proficiency in at least one grade level on either the CST math or English exam. For this result to occur, even if every low-income student at a school performed below the proficient mark, a significant percentage of non-low-income students also had to perform below proficiency.

Based on these criteria, the 2007 book found almost 300 public schools in California with predominantly non-low-income student populations where more than half of the students in at least one grade level failed to reach proficiency in either math or English on the state exam.

In the 2009 update “Still Not as Good as You Think,” in addition to the list of public schools compiled using the one-third/two-thirds division and the 50-percent-or-more non-proficient grade-level benchmark, a second list of schools was compiled using a 20-percent/80-percent division between low-income and non-low-income students and a 40-percent-or-more non-proficient grade-level benchmark on the state math and English exams.

This current study uses the 33/50 criteria and applies it to regular public schools in Texas. The Texas Education Agency uses the term “economically disadvantaged” to signify low-income status for students. According to the agency:

An economically disadvantaged student is defined as one who is eligible for free or reduced-price meals under the National School Lunch and Child Nutrition Program.<sup>3</sup>

In addition to the 33/50 criteria, this study will also use a “regression line” method to analyze the performance of predominantly non-low-income schools in Texas.’

# Texas Academics Standards and Testing

There are several ways to address the question of how well non-low-income students in Texas are performing. To get a big picture of the achievement of Texas non-low-income students, one of the first places to which researchers turn is to the state's results on the National Assessment of Educational Progress (NAEP).

## **NAEP: The Nation's Report Card**

Often referred to as the nation's report card, the NAEP exams are used in virtually all states and test students periodically in the core subjects:

Students are tested in a variety of different subject areas and grade levels, and they are scored as either achieving advanced, proficiency, basic or below basic in a specific subject. The Commissioner of Education Statistics, under the U.S. Department of Education, is responsible for overseeing the NAEP. The National Assessment Governing Board, an independent, bipartisan board appointed by the Secretary of Education, is responsible for determining the framework and assessments given. The Board also defines basic, proficient, and advanced levels for each grade.

Achieving 100 percent proficiency on NAEP exams is a goal that all schools should be striving for.<sup>4</sup>

In defining "proficiency," the U.S. Department of Education states: "This level represents solid performance for each grade assessed," and that students reaching the proficient level "have demonstrated competency over challenging subject matter, including subject matter knowledge, application of such knowledge to real world situations, and analytical skills appropriate to the subject matter."<sup>5</sup> In contrast, to achieve a "basic" level, a student need display only partial mastery of perquisite knowledge and skills that are fundamental for proficient work at that grade level. Texas, like most other states, uses the NAEP to test its students.

Paul Peterson of Harvard University and Fredrick Hess of the American Enterprise Institute (AEI) have written that the difficulty level of NAEP's test items and its definition of "proficiency" have been judged to be on par with the standards used by designers of international tests of student achievement. "Proficiency," they conclude, "has acquired roughly the same meaning in Europe and Asia, and in the United States—as long as the NAEP standard is employed."<sup>6</sup>

NAEP uses matrix sampling, a testing technique that assembles different assessment documents covering different aspects of a subject. These different assessments are administered to different sample sets of students. In other words, on the NAEP reading exam not every student answers the same questions. Aggregate scores for all students are then calculated.<sup>7</sup>

Since NAEP uses matrix sampling, it is impossible to compare scores between students or between schools. This situation is unlike state tests, such as the Texas STAAR exam, which allow for such comparisons, since all students in a given grade level take the same test and answer the same questions. NAEP produces statewide data and allows for comparisons of performance between states and gives a picture of statewide student performance.

*On the 2013 NAEP  
fourth-grade reading exam,  
53 percent of Texas students  
not eligible for the NSLP  
failed to score at the  
proficient level. ...*

*On the 2013 NAEP  
eighth-grade reading exam,  
54 percent of non-low-  
income Texas students failed  
to score at or above the  
proficient level. Nearly half,  
47 percent, failed to score  
at or above proficiency on  
the NAEP eighth-grade  
math exam.*

The most recent NAEP results show that Texas has not only failed to come close to the 100-percent proficiency goal for all students, the state has also failed to come close to this proficiency goal for non-low-income students, who are often assumed to be higher achieving.

NAEP scores can be broken down into various group categories, including by participation and non-participation in the NSLP. On the 2013 NAEP fourth-grade reading exam, 53 percent of Texas students not eligible for the NSLP failed to score at the proficient level. Non-low-income Texas fourth graders did better in math, with 37 percent, less than four out of 10, failing to score at or above the proficient level on the NAEP fourth-grade math exam. The results, however, were worse for non-low-income Texas eighth graders.

On the 2013 NAEP eighth-grade reading exam, 54 percent of non-low-income Texas students failed to score at or above the proficient level. Nearly half, 47 percent, failed to score at or above proficiency on the NAEP eighth-grade math exam.

NAEP identifies “advanced” as signifying “superior performance.”<sup>8</sup> On the 2013 fourth-grade NAEP reading exams, 87 percent of Texas non-NSLP-eligible test takers failed to reach the advanced level, while 85 percent failed to reach advanced on the fourth-grade NAEP math exam. On the eighth-grade NAEP reading exam, a stunning 96 percent of non-low-income test-takers failed to achieve the advanced level. On the eighth-grade math exam, 86 percent of non-low-income test takers failed to make the advanced level.

Not only has the achievement level of non-low-income students in Texas failed to approach the 100-percent proficiency goal, it also compares unfavorably with the performance of similar students in other states. For example, Massachusetts is ranked among the leaders in NAEP performance, and its non-low-income students significantly outperform their peers in Texas.

On the 2013 NAEP fourth-grade math exam, 26 percent of non-low-income students in Massachusetts failed to reach proficiency versus 37 percent in Texas. On the fourth-grade reading exam, 38 percent of Massachusetts non-low-income test-takers failed to hit proficiency, while 53 percent of non-low-income Texas test-takers failed to do so. There were similar disparities on the eighth-grade NAEP exams.

On the eighth-grade NAEP math exam, 31 percent of non-low-income students in Massachusetts failed to hit the proficiency mark, while 47 percent of non-low-income Texas eighth-graders failed to achieve proficiency. On the eighth-grade reading exam, 39 percent of non-low-income students in Massachusetts failed to score at the proficient level, while 54 percent of non-low-income Texas students failed to achieve proficiency.

Thus, not only are large proportions of non-NSLP-eligible Texas students failing to achieve proficiency on NAEP exams, they are failing to achieve proficiency at the rate of their peers in higher-performing states like Massachusetts. However, to understand the full extent of the poor performance of non-NSLP-eligible Texas students, one must analyze their performance on the Texas STAAR exam.

*Not only are large proportions of non-NSLP-eligible Texas students failing to achieve proficiency on NAEP exams, they are failing to achieve proficiency at the rate of their peers in higher-performing states like Massachusetts.*

# State of Texas Assessments of Academic Readiness (STAAR)

Any discussion of state testing must first start with an examination of the rigor of a state's subject-matter standards. States with challenging and rigorous subject-matter standards will usually have rigorous tests since state tests are aligned with state standards. Thus, prior to the advent of the national Common Core education standards, states such as California and Massachusetts had their own rigorous individual state standards, plus standards-aligned tests that also were considered rigorous. In Texas, the state's English Language Arts (ELA) standards have received excellent marks, but the state's math standards have received less-than-stellar reviews.

The Thomas B. Fordham Institute has been grading state subject-matter standards for years. In its 2010 report on state standards, Fordham gave California an "A" and Massachusetts an "A-" for their ELA standards. Texas also ranked well, receiving an "A-" from Fordham for its English Language Arts standards. According to the Fordham report:

The Texas ELA standards are clearly organized, specific, and include nearly all of the essential K-12 content. They provide excellent guidance to teachers in the Lone Star State and help ensure that all students will be held to equally rigorous standards.<sup>9</sup>

Specifically, the report says that the Texas ELA standards "clearly outline what students should know and be able to do from grade to grade." Thus, for example, "A systematic, detailed progression of expectations for early reading is provided, including rigorous standards devoted to phonics, and phonemic and phonological awareness."<sup>10</sup> Further, "Expectations for vocabulary development are similarly rigorous and include standards devoted to etymology, knowledge of roots and affixes, connotation and denotation, figurative language, appropriate use of context clues, and the use of dictionaries and thesauruses to confirm meaning."<sup>11</sup>

In comparison to the new Common Core ELA standards, which Texas has resisted adopting, Texas's state ELA standards stack up very well. The Fordham Institute, which is pro-Common Core, says that Texas's ELA standards are better than Common Core in key areas:

Texas's ELA standards are more clearly written, better presented, and logically organized than the Common Core standards. The Texas standards include expectations that more thoroughly address the comprehension and analysis of literary and non-literary text than Common Core, including helpful, detailed standards that outline genre-specific content and rhetorical techniques. In addition, Texas has prioritized writing genres by grade level.<sup>12</sup>

In mathematics, the 2010 Fordham report gave California's standards an "A+," while Massachusetts received a "B+" for its standards. In contrast, Texas's math standards received a middling grade of "C." Texas, however, revised its math standards in 2012. Fordham then issued an evaluation of the new Texas math standards.

The new Texas math standards, observed Fordham, were an improvement over the state's previous math standards:

The new standards are an improvement. Some content that was previously missing from the standards has been included, the standards remain clear and well organized, and the high school content remains strong.<sup>13</sup>

However, while the new Texas math standards “are strong in places, especially in high school,” the standards reviewed by Fordham were “nowhere near the best of the standards that were in place in states such as California and Florida.”

While academic-content standards provide the foundation for accountability and learning in the classroom, tests measure the extent of student of learning. Testing in Texas has changed over the last several years.

For many years, Texas administered the Texas Assessment of Knowledge and Skills (TAKS) exam to measure student learning in the core subjects. The TAKS exam was widely criticized for being less than demanding. After being asked by a local television station to answer 27 TAKS questions, Dr. James Rennier, dean of the College of Fine Arts and Humanities at West Texas State University, concluded: “My first impression was it’s too easy. My last impression, it’s too easy.”<sup>14</sup>

Indeed, school proficiency rates were sky-high under TAKS, which seemed to promote a Lake Woebegone effect: all kids are above average. In response, in 2011-12 Texas replaced TAKS with the State of Texas Assessments of Academic Readiness (STAAR) exams. In announcing the new STAAR exam, then-Texas education commissioner Robert Scott explained that the STAAR exams would be more rigorous than TAKS.

In structure, the STAAR exams in grades 3-8 resemble the prior TAKS exams, with individual tests given in each of these grades in the core subjects of English language arts and mathematics. In addition, exams in writing, science and social studies are given in selected grades. The STAAR exams in high school, however, are structurally different than the prior TAKS exams.

Thus, for example, instead of having a single broad unified ninth-grade math test, STAAR introduced 12 end-of-the-course (EOC) exams in specific subjects, such as Algebra I or Geometry. In other words, a ninth-grade student taking Algebra I would take the STAAR Algebra I end-of-course exam as opposed to the old TAKS ninth-grade math exam.

One wrinkle to the STAAR exams occurs if a non-high-school student is taking a subject with an end-of-the-course exam. In such a situation, the Texas Education Agency says:

*School proficiency rates were sky-high under TAKS, which seemed to promote a Lake Woebegone effect: all kids are above average.*

If a student is enrolled in grade 8 or below and is taking a course for which there is a STAAR EOC assessment, that student will be required to take the applicable STAAR EOC test. For example, an eighth grade student enrolled in Algebra I will take the STAAR Algebra I EOC, as well as the grade 8 reading, science, and social studies assessments. Local school district policy will determine whether this student will also take the STAAR grade 8 mathematics assessment.<sup>15</sup>

Thus, when reading school performance spreadsheets, such as the ones contained in the appendix of this study, the proficiency rates for the middle-school eighth-grade STAAR math exam may not include the results of all eighth graders at a school because some eighth graders may, instead, take an end-of-the-course exam in a subject such as Algebra I and not be required by the local school district to take the STAAR eighth-grade math exam. Caution should therefore be used when reading eighth-grade math performance statistics.

The STAAR exam has three performance levels: Level III-Advanced Academic Performance, Level II-Satisfactory Academic Performance, and Level I-Unsatisfactory Academic Performance. The Texas Education Agency defines these different levels of performance as follows:

### **Level III: Advanced Academic Performance**

Performance in this category indicates that students are well prepared for the next grade or course. They demonstrate the ability to think critically and apply the assessed knowledge and skills in varied contexts, both familiar and unfamiliar. Students in this category have a high likelihood of success in the next grade or course with little or no academic intervention. *\* For Algebra II and English III, this level of performance also indicates students are well prepared for postsecondary success.*

### **Level II: Satisfactory Academic Performance**

Performance in this category indicates that students are sufficiently prepared for the next grade or course. They generally demonstrate the ability to think critically and apply the assessed knowledge and skills in familiar contexts. Students in this category have a reasonable likelihood of success in the next grade or course but may need short-term, targeted academic intervention. *For Algebra II and English III, this level of performance also indicates students are sufficiently prepared for postsecondary success.*

### **Level I: Unsatisfactory Academic Performance**

Performance in this category indicates that students are inadequately prepared for the next grade or course. They do not demonstrate a sufficient understanding of the assessed knowledge and skills. Students in this category are unlikely to succeed in the next grade or course without significant, ongoing academic intervention.<sup>16</sup>

To pass a STAAR exam, students must at least achieve Level II-Satisfactory Academic Performance:

The academic performance standards are the cut scores on a test that divide students into these three levels. A student is considered to have passed a given STAAR assessment if he/she earned a score at least as high as the cut score for Level II: Satisfactory Academic Performance.<sup>17</sup>

The cut score, which defines how many questions students must answer correctly in order to achieve the different performance levels, is therefore crucially important. There will be a three-step phase-in process whereby the cut scores will be raised in each phase-in period. Thus, the cut scores for Phase 1 will be relatively low; the cut scores for Phase 2 will be raised to a higher benchmark; and the final Recommended cut scores will be an even higher benchmark. As of May 2014, the Texas Education Agency, said that the phase-in schedule would look as follows:

The STAAR 3–8 phase-in standards for Level II performance began with the 2012 test administration. Phase-in 1 standards for Level II are in effect for the 2011–2012, 2012–2013, and 2013–2014 school years. Phase-in 2 standards and eventually final recommended Level II standards will take effect in subsequent years (pending annual review of student performance by the commissioner of education).<sup>18</sup>

However, in August 2014, the Texas Education Agency changed course and decided to extend the timeline so that the less demanding Phase 1 standards for Level II would be in effect for the 2014–15 school year. The final Recommended standards for Level II would not take effect for many years. According to *The Dallas Morning News*:

When the first STAAR tests were given in 2012, passing requirements for the new and tougher assessments were supposed to jump in two steps over five years. By 2016, students were expected to hit marks the state defined as a path to “postsecondary readiness.”

The latest plan, released by the Texas Education Agency on Aug. 21, [2014] pushes that “final recommended” standard back to the 2021–22 school year. So this year’s new first-graders won’t be facing the final standards until eighth grade.<sup>19</sup>

The newspaper further pointed out that, “Had the 2014 students needed to meet the ‘final recommended’ standard, more than half of students would have failed every test.”<sup>20</sup>

Texas Education Commissioner Michael Williams has testified before the Texas legislature saying, “There are 70 separate validity studies associated with the variety of STAAR exams.” He concludes, “I am hard pressed to quibble with the quality of the exam.”<sup>21</sup> If the validity and quality of the STAAR exams are beyond reproach, as Commissioner Williams argues, then pushing the timeline back seems to be a move designed mainly to prevent potential public uproar over large numbers of students failing the exams rather than any inherent problem with the final Recommended standard. Indeed, *The Dallas Morning News* reported that the Texas Education Agency has slowed its timeline a couple times because of continuing low student performance on the STAAR exams:

The recent [August 21, 2014] TEA announcement is actually the second time the agency rejiggered the timeline. The original plan was for a lowest passing mark for two years, then two years at an interim level. The “final recommended” standards were to kick in for the fifth year of the tests. Last year, when it was clear there had been no improvement in scores, the first jump was postponed.<sup>22</sup>

It must be pointed out that the final phase Recommended cut score is the benchmark goal that guides the cut-score setting process. Phase 1 and Phase 2 cut scores for Level II-Satisfactory Academic Performance are based on the final Recommended cut score:

Phase-in cut scores were determined empirically for each STAAR assessment based on the recommended Level II cut scores. For STAAR [End-of-Course], phase-in 1 cut scores for Level II were set at 1.0 standard deviation (SD) below the Level II recommended cut scores for the STAAR mathematics, science, and social studies assessments and at 0.5 SD below the Level II recommended cut scores for the STAAR English assessments. Phase-in 2 cut scores for Level II were set at 0.5 SD below the Level II recommended cut scores for the STAAR mathematics, science, and social studies assessments, and at 0.2 SD below the Level II recommended cut scores for the STAAR English assessments.

For all STAAR 3–8 assessments, phase-in 1 cut scores for Level II were set at 1.0 SD below the Level II recommended cut scores, and phase-in 2 cut scores were set at 0.5 SD below the Level II recommended cut scores. These phase-in cut scores are all higher than the TAKS “Met” performance standard.<sup>23</sup>

The actual cut scores for Level II-Satisfactory Academic Performance for the different phase-in periods are:

## **Level II: Satisfactory Academic Performance**

The phase-in 1 standard is

- 3500 for mathematics, science, and social studies EOC assessments
- 3750 for English EOC assessments

The phase-in 2 standard is

- 3750 for mathematics, science, and social studies EOC assessments
- 3900 for English EOC assessments

The recommended standard is

- 4000 for English, mathematics, science, and social studies EOC assessments<sup>24</sup>

*The Dallas Morning News* reported that in order to achieve Level II-Satisfactory Academic Performance, a student had to answer many more questions correctly for the final phase Recommended standard than for the Phase 1 standard:

A seventh-grader, for example, needed to get 22 questions out of 52 correct on [the 2014] math test to pass under Phase 1. To pass under Phase 2 would have required getting 30 questions right. And a recommended passing score would have required 37 correct answers.

Passing levels for other tests would change by roughly comparable numbers.<sup>25</sup>

The disparity between the number of correct answers needed in the different phase-in periods to achieve Level II-Satisfactory Academic Performance is wide. Answering 42 percent of questions correctly (22 out of 52) on the seventh-grade STAAR math test is a very low bar, even with the Texas Education Agency’s caution that “answering fewer than 70 percent of the questions correctly on a test does not necessarily indicate poor performance either in terms of scale scores or mastery of the assessed content.”<sup>26</sup>

*Answering 42 percent of questions correctly (22 out of 52) on the seventh-grade STAAR math test is a very low bar.*

After every annual administration of the STAAR exams, the Texas Education Agency “will review the percentage of students meeting the phase-in and final recommended Level II performance standards and make a recommendation to the commissioner of education about whether the implementation timeline for phase-in standards should be extended.” The Agency then says: “The commissioner will decide between extending the current phase-in standards or proceeding to the next phase-in or final recommended standards.”<sup>27</sup>

Texas Education Commissioner Michael Williams, in defending his action to extend the Phase 1 cut-point benchmarks, has said: “While I firmly believe that Texas students are capable of reaching the high expectations in the final recommended performance standards, I also recognize that the development of strong, coherent, vertically aligned instructional programs requires time and sustained effort.”<sup>28</sup> Perhaps so, but there is no getting around the fact that Texas itself has said that the final Recommended Level II standard is the performance goal for students, and that Level II proficiency benchmarks under Phase 1 are set very low.

In view of the low Phase 1 cut-point benchmark, and given that Texas says that the Recommended standard in the final phase is the state’s goal, this paper will compare the performance of predominantly non-low-income schools using both Phase 1 and Recommended standards, emphasizing the performance of schools under the Recommended standards.<sup>29</sup>

# Analysis of Individual Texas Public Schools

## The 33/50 Schools

As was mentioned previously, NAEP scores are useful in giving a big-picture statewide double check on student achievement, but they cannot be used to evaluate individual school performance. Given that limitation, there are other ways to analyze the performance of individual Texas public schools.

Of 1,115 regular public schools with predominantly non-low-income student populations, 673, or 60 percent, had at least one grade-level STAAR math or reading exam where 50 percent or more of their students failed to reach proficiency.

First, one can simply employ the methodology used in the 2007 PRI *Not as Good as You Think* book, which focused on public schools with 33 percent or fewer of students on the National School Lunch Program (NSLP) and 50 percent or more of students in at least one grade level that failed to achieve proficiency on the state tests. Since California's standards were very rigorous, the state tests were also challenging and resulted in many schools with predominantly non-low-income students meeting that threshold. In view of the inflated proficiency rates on the STAAR exam under the Phase 1's Level II proficiency cut points, it is not surprising that relatively few schools have 50 percent or more of their students in at least one grade level failing to reach proficiency on one subject-matter test. However, if one uses the final phase Recommended cut points, which the state says are the ultimate recommended benchmarks, then significant numbers of schools fall into the 33/50 category.

For descriptive purposes, the terms "proficient" or "proficiency" will be used for the term "satisfactory academic performance," which is associated with Level II student performance on the STAAR exams.

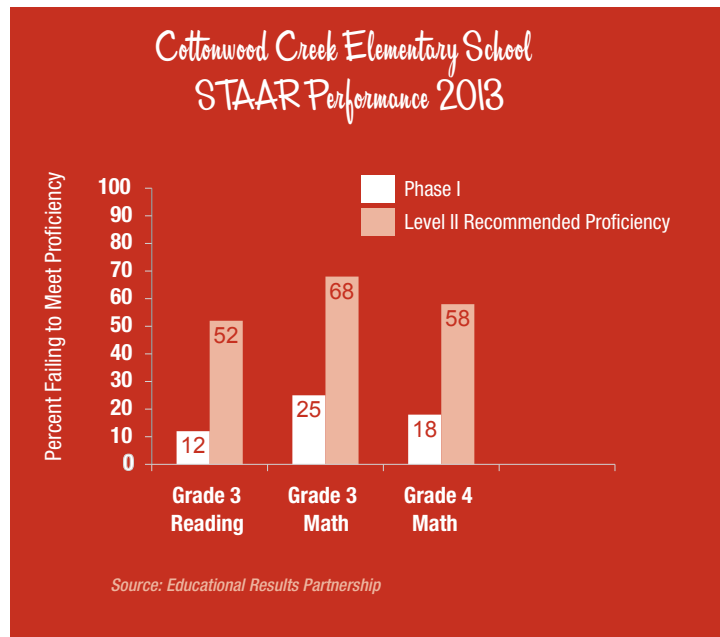

The STAAR results used in this paper are from the 2013 exam (the 2014 results did not come out in time to be incorporated into this paper's analysis). The use of 2013 data versus 2014 data should not make any substantial difference in the ultimate conclusions of this paper since, as *The Dallas Morning News* has noted: "An analysis earlier this year by *The News* showed that no average score on any STAAR test changed more than the equivalent of two additional questions right or wrong over the three years."<sup>30</sup>

Based on the 2013 STAAR results and using the final Recommended Level II benchmark of proficiency, out of 1,115 regular public schools with predominantly non-low-income student populations, 673, or 60 percent, had at least one grade-level STAAR math or reading exam where 50 percent or more of their students failed to reach proficiency. In comparison, using the Phase 1 Level II benchmark of proficiency, only 11 schools had at least one grade-level STAAR math or reading exam where 50 percent or more of their students failed to reach proficiency. The following are some examples of the schools that are not as good as you would think.

Cottonwood Creek Elementary School is located in the city of Coppell in Dallas County. Coppell has grown from a small farming village to an affluent bedroom suburb of 40,000 in the Dallas-Fort Worth metro area. One hundred percent of the city's population is classified as urban.

In 2012, the median household income in Coppell was \$102,847, which was double the statewide median of \$50,740. The median house/condominium value in Coppell in 2012 was \$271,678, which was more than double the statewide median of \$129,200.<sup>31</sup> For descriptive purposes, the median house/condo information used in the text of this study is based on the median house/condo price for the village, town or city in which the school is located. In the appendix of this study the median house/condo information in the spreadsheet for all predominantly non-low-income schools is based on the median house/condo price for the zip code in which the school is located.

The residents of Coppell are highly educated, with more than 63 percent of those 25 years old or older having a bachelor's degree or higher. In July 2013, the unemployment in Coppell was 5.8 percent, which was lower than the Texas statewide rate of 6.7 percent.<sup>32</sup>

In 2013, Cottonwood Creek Elementary had 519 students, with the large majority consisting of white and Asian students. Whites represented 47 percent of the student body, while Asians represented 35 percent. Only a small 3.9 percent of Cottonwood Creek students were classified as economically disadvantaged. Yet, despite the paucity of low-income students, many of the school's students failed to reach proficiency as defined under final phase Recommended Level II cut-points.

Among third graders at Cottonwood Creek, more than 52 percent failed to meet or exceed the Level II proficiency, based on the final phase Recommended benchmark, on the 2013 STAAR reading exam, while 68 percent of third graders failed to meet or exceed the Recommended proficient level on the STAAR math exam. In comparison, only 12 percent of third graders failed to meet or exceed the Level II proficient level, based on the Phase 1 benchmark, on the 2013 STAAR reading exam, while just 25 percent of third graders failed to meet or exceed Phase 1 proficiency on the STAAR math exam.

For fourth graders at Cottonwood Creek, 58 percent failed to meet or exceed Recommended proficiency on the STAAR math exam. In comparison, only 18 percent of fourth graders failed to meet or exceed Phase 1 Level II proficiency on the 2013 STAAR math exam.

Homestead Elementary School is located in the city of Carrollton, parts of which are in Denton, Dallas, and Collin counties. A suburb of Dallas, Carrollton has been named by *Money* magazine and others as one of the best places to live in America. In 2012, there were 125,409 people living in Carrollton.

The median household income in Carrollton in 2012 was higher than the statewide average, \$66,329 to \$50,740. Also, Carrollton's median house/condominium value was \$167,500 versus the statewide median value of \$129,200.<sup>33</sup>

In July 2013, unemployment in Carrollton was 5.8 percent, which was lower than the statewide rate of 6.7 percent.<sup>34</sup>

At Homestead Elementary in 2013, more than 55 percent of the school's 619 students were white, while 20 percent were Hispanic and 12 percent were Asian. Less than 14 percent of Homestead's students were economically disadvantaged.

Recent publicly posted comments by Homestead parents are mixed. One parent said, "We have been at Homestead for two years and we love it!" However, another parent criticized the school harshly saying, "The school (most of the teachers and administration) focus mostly on behavior rather than academics and it doesn't help or improve behavior in any way."<sup>35</sup> The latter parent may have a point since, based on the Recommended Level II benchmarks, many Homestead students failed to reach proficiency.

Among third graders at Homestead, 70 percent failed to meet or exceed the proficient level, based on the Recommended Level II proficiency cut-point, on the 2013 STAAR math exam. In comparison, less than 24 percent of Homestead third graders failed to meet or exceed the proficient level, based on the Phase 1 benchmark, on the 2013 STAAR math exam.

For fourth graders at Homestead, 73 percent failed to meet or exceed Recommended Level II proficiency on the 2013 STAAR math exam. In comparison, 29 percent of fourth graders failed to meet or exceed Phase 1 Level II proficiency on the STAAR math exam.

Finally, among Homestead fifth graders, more than 51 percent failed to meet or exceed the Recommended Level II proficient level on the STAAR math exam. In comparison, 16 percent of Homestead fifth graders failed to meet or exceed the proficient level, based on the Phase 1 Level II benchmark, on the 2013 STAAR math exam.

Another Dallas-area school is Liberty Elementary, which is located in the city of Flower Mound. After the construction of the nearby Dallas/Fort Worth International airport in the early 1970s, Flower Mound became one of the fastest growing cities in the United States. In 2012, the population stood at 67,825.

The median household income in Flower Mound in 2012 was \$113,683, which was more than double the statewide median of \$50,740. Flower Mound's median house/condominium value was \$277,900, more than double the statewide median value of \$129,200.<sup>36</sup>

More than half of Flower Mound's residents 25 years old or older had a bachelor's degree or higher. The July 2013 unemployment rate in the city was 5.5 percent, lower than the statewide rate of 6.7 percent.<sup>37</sup>

At Liberty Elementary, more than 68 percent of the students are white and 19 percent are Asian. Just 1.4 percent of the school's students are economically disadvantaged.

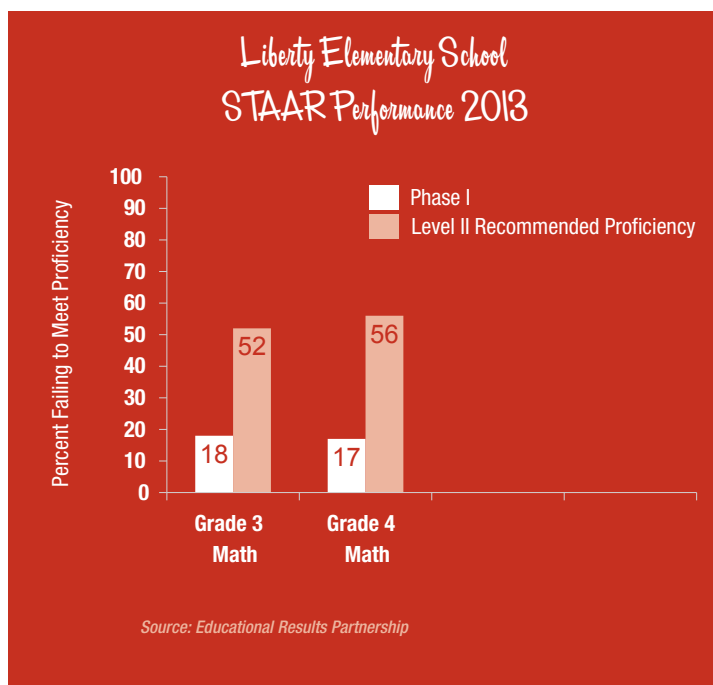

Recent parent postings about Liberty Elementary are mixed, but one very pro-Liberty parent wrote:

If you thought Liberty was a good school before, you will be amazed how positive it is with our new principal and assistant principal... There just seems to be such a confident attitude from the parents, to teachers to the kids in the halls. There is really a communication between the needs of the parents and teachers and leadership that are helping to facilitate what is best for our kids... a new page has turned for Liberty -- many feel that it is a VERY POSITIVE change. This is not just a “get the job done” group anymore, it’s a “HOW CAN WE BE SUCCESSFUL and MAKE OUR KIDS FEEL GOOD AND SUCCESSFUL TOO” group... the halls are no longer cold!!! I finally feel like we are going to be heard and not told how it’s done WOOHOO!!! GO LIBERTY!!!!!!<sup>38</sup>

Despite this positive review and the miniscule proportion of low-income students at Liberty, math performance at the school is a concern.

Among third graders at Liberty, 52 percent failed to meet or exceed the proficient level, based on the Recommended Level II proficiency benchmark, on the 2013 STAAR math exam. In comparison, 18 percent of Liberty third graders failed to meet or exceed the Level II proficient level, based on the Phase 1 Level II benchmark, on the 2013 STAAR math exam.

For fourth graders, 56 percent failed to meet or exceed Recommended Level II proficiency on the STAAR math exam. In comparison, 17 percent of Liberty fourth graders failed to meet or exceed the proficient level, based on the Phase 1 Level II benchmark, on the 2013 STAAR math exam.

Less than 50 miles outside Austin, in Bell County, is the village of Salado, home to Salado High School. Founded by Scottish settlers, Salado is the site of the first coeducational college in Texas. The village touts itself as the best art town in Texas. As of 2012, the population was 2,154.

The median household income in Salado in 2012 was \$79,910, which was significantly higher than the statewide median of \$50,740. Salado’s median house/condominium value in 2012 was \$227,225, almost \$100,000 more than the statewide median of \$129,200.<sup>39</sup>

More than 47 percent of Salado’s residents 25 years or older had a bachelor’s degree or higher. The July 2013 unemployment rate of 7.2 percent was higher than the statewide rate of 6.7 percent.<sup>40</sup>

At Salado High School, 76 percent of the school’s 452 students in 2013 were white, while less than 18 percent were Hispanic. Less than 20 percent of the school’s students were economically disadvantaged.

Combining 2013 end-of-course exams in algebra I, geometry and algebra II, more than 51 percent of Salado High students failed to meet or exceed the proficient level, based on Recommended Level II proficiency cut-points. In comparison, less than 11 percent of Salado students failed to meet or exceed the proficient level on the end-of-course math exams, based on the Phase 1 Level II benchmark.

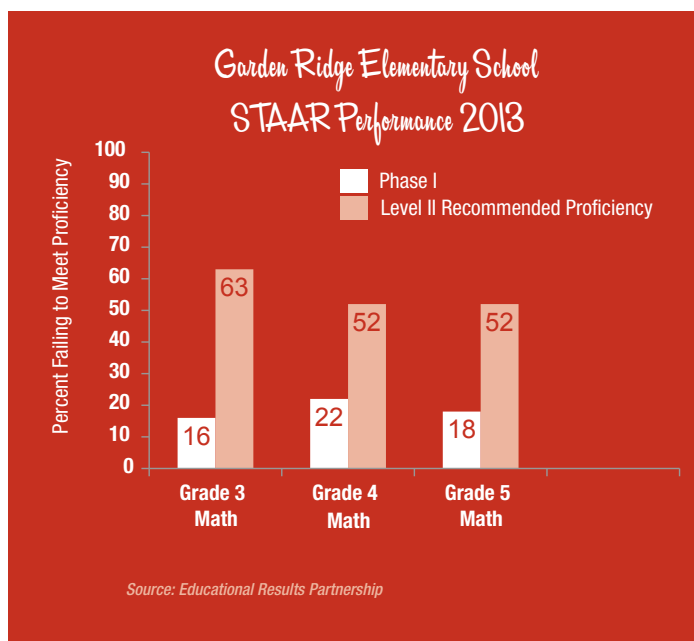

Garden Ridge Elementary School is located in the city of Garden Ridge, which is in Comal County and which is part of the San Antonio Metropolitan Statistical Area. The city is near the Bracken Cave, which is famed for its population of 40 million bats. The human population of Garden Ridge in 2012 was 3,503.

The median household income in Garden Ridge in 2012 was \$124,837, which was 146 percent higher than the statewide median of \$50,740. Garden Ridge's median house/condominium value in 2012 was a whopping \$405,157, which dwarfed the statewide median of \$129,200.<sup>41</sup>

More than 62 percent of Garden Ridge residents 25 years or older had a bachelor's degree or higher. The July 2013 unemployment rate of 6.7 percent exactly mirrored the statewide rate.<sup>42</sup>

At Garden Ridge Elementary, 69 percent of the school's 536 students in 2013 were white, while 19 percent were Hispanic. Twelve percent of the school's students were economically disadvantaged.

On the website for Garden Ridge Elementary, the school is listed as a Texas Exemplary Campus. According to the posted message from the school's principal, Garden Ridge is "dedicated to empowering students to achieve high academic standards and discover their unique talents and gifts."<sup>43</sup> However, based on Recommended Level II STAAR scores, the school has a way to go to achieve its desired high levels of student performance.

Among third graders at Garden Ridge, 63 percent failed to meet or exceed the proficient level, based on the Recommended Level II proficiency cut-point, on the 2013 STAAR math exam. In comparison, 16 percent of Garden Ridge third graders failed to meet or exceed the proficient level, based on the Phase 1's Level II benchmark, on the 2013 STAAR math exam.

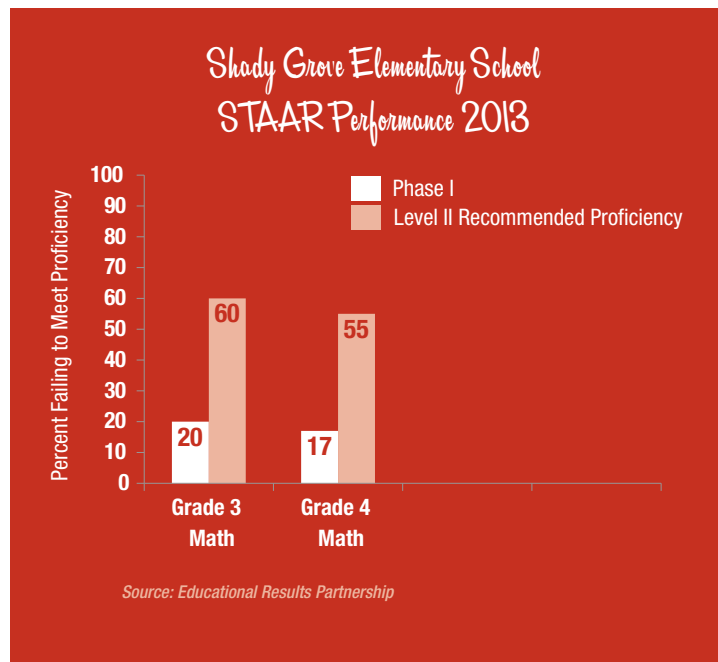

Also, more than 52 percent of both Garden Ridge fourth and fifth graders failed to meet or exceed the Recommended Level II proficiency on the STAAR math exam. In comparison, 22 percent of Garden Ridge fourth graders and 18 percent of fifth graders failed to meet or exceed the proficient level, based on Phase 1's Level II benchmark, on the 2013 STAAR math exam.

Shady Grove Elementary School is located in the city of Keller, which is in Tarrant County. Keller is a northern suburb of Fort Worth, and in 2009 the city was ranked 7<sup>th</sup> on CNN/*Money* magazine's list of 100 "Top places to live -- America's best small towns."<sup>44</sup> Keller's population in 2012 was 41,923, which was a whopping 53 percent increase over the 2000 total.

The median household income in Keller in 2012 was \$113,712, which was more than double the statewide median of \$50,740. The median house/condominium value was \$269,802, while the statewide median was \$129,200.<sup>45</sup>

Almost 53 percent of Keller residents 25 years or older had a bachelor's degree or higher. The July 2013 unemployment rate in the city was 5.5 percent, lower than the statewide rate of 6.7 percent.<sup>46</sup>

At Shady Grove Elementary, more than 76 percent of the school's 489 students in 2013 were white, with 10 percent Hispanic and 7 percent Asian. Less than 4 percent of students were economically disadvantaged.

In a positive review of the school, one parent wrote: "The school is absolutely fantastic and is focused on the children first! Excellent teachers that really care!"<sup>47</sup> While the teachers may care, there is a question as to whether the students are learning all that they should learn in order to achieve at high levels.

Among third graders at Shady Grove, 60 percent failed to meet or exceed the proficient level, based on the Recommended Level II proficiency benchmark, on the 2013 STAAR math exam. In comparison, 20 percent of Shady Grove third graders failed to meet or exceed the proficient level, based on Phase 1's Level II benchmark, on the 2013 STAAR math exam.

Also, 55 percent of Shady Grove fourth graders failed to meet or exceed Recommended Level II proficiency on the STAAR math exam. In comparison, 17 percent of Shady Grove fourth graders failed to meet or exceed the proficient level, based on Phase 1's Level II benchmark, on the 2013 STAAR math exam.

# Schools Below the Poverty/Performance Line

The limitation of Texas's proficiency bar, under Phase 1 Level II cut-points, is that it has been set relatively low. Simply using a benchmark such as 50 percent or more students who are non-proficient on a grade-level test will not give the full picture of school underperformance. For this reason, it is worth turning to another method of analysis that shows the relationship between school performance and student income status.

If one plots regular public schools in Texas on graphs with the percent of students proficient (based on Recommended Level II proficiency cut-points) on a grade-level subject-specific test on the y-axis and the percent of students who are economically disadvantaged/low income on the x-axis, then one will get a scatterplot with each individual dot representing a school with a certain percent of students performing at proficiency and a certain percent of students who are low income. Plotting schools on such a graph is useful because the regression line that can be drawn and fitted on the graph will then tell us about which schools are performing below average.

In comparing public schools for the purpose of this analysis, simple linear regression modeling was used to show the relationship between the percentage of students in a school who are classified as coming from low-income households and the percent of students proficient (at grade level), using the Recommended Level II benchmarks, in the school for a particular grade and subject. This analysis for each grade in reading and math allows for the identification of schools that are performing above or below average performance based on the performance of all the other schools in the state.

In other words, the regression line is the relationship between school performance and student income level, based on low-income and non-low-income classifications.

Of course, what constitutes "school performance" would look very different depending on whether one used Phase 1's Level II definition of proficient performance or the Recommended definition of Level II proficiency. For this analysis, the Recommended Level II definition of proficiency is used.

Schools on the regression line itself are performing at the average given the performance of all other schools in the state and the income status of students. Schools below the regression line are performing below the average performance of schools with students of the same income status, while schools above the regression line are performing above the average relative to schools with students of the same income status.

For the purpose of this paper, the schools of interest occupy the area below the regression line from 0 to 33 percent on the x-axis (see Appendix A). These are schools that have predominantly non-low-income students, but which are performing below average based on the performance of all other schools in Texas. The farther a school falls below the regression line, the farther its performance below the average.

A scatterplot and regression line is done for each grade level and for each subject-matter test. Thus, for example, there is a scatterplot of schools and a regression line based on the fourth-grade STAAR reading exam results. There is also a separate scatterplot and regression line for the fourth-grade STAAR math exam, and so forth for every grade level and every subject-matter test.

Comparing where a school is plotted on the scatterplot graph and where it should be if it were on the regression line gives one an idea of the below-average or above-average performance of the schools in relation to the average based on the regression line. Again, the regression line represents the current Texas average performance, using Recommended Level II proficiency benchmarks, given the income status of the students. The amount of below-average or above-average performance can be expressed in percentage points. So, for example, on the STAAR third-grade reading exam, Earl and Lottie Wolford Elementary School in Collin County is 12.9 percentage points below the average performance (using the Recommended Level II proficiency benchmark), based on the regression line, for a school with just under 8 percent of its students categorized as economically disadvantaged.

The below-average or above-average performance for each predominantly non-low-income Texas public school can be viewed by looking at the grade-level ELA LR Gap (English-language-arts linear regression) or Math LR (Math linear regression) Gap columns listed in Appendix B. Negative numbers indicate percentage points below the regression line (below-average performance), and positive numbers indicate percentage points above the regression line (above-average performance).

Among the 1,115 regular public schools with 33 percent or fewer of students coming from low-income households, 758 have at least one grade where the subject-matter proficiency rate was below the regression line. In other words, 68 percent of these predominantly non-low-income schools had at least one grade where students performed below the proficiency average on a subject-matter test. The following is the breakdown of the number of underperforming regular public schools per grade level for reading and math:

Grade	Number of Schools Underperforming in Reading	Number of Schools Underperforming in Math
3	248	258
4	265	243
5	245	224
6	112	112
7	100	101
8	99	106
9-12	36	122

Source: Educational Results Partnership

Elliott Elementary School is located in McKinney, the county seat of Collin County. McKinney is about 30 miles north of Dallas. From 2000 to 2003, McKinney was the fastest growing city in America with more than 50,000 residents, according to the U.S. Census Bureau. In 2012, *Money* magazine ranked McKinney as the second best place to live in America.<sup>48</sup> In 2012, McKinney's population was 143,223, which was a 163 percent increase over the city's population in 2000.

The median household income in McKinney in 2013 was \$79,171, which was significantly higher than the statewide median of \$50,740. McKinney's median house/condominium value in 2013 was \$194,900, which was much higher than the statewide median of \$129,200.<sup>49</sup>

Close to half of McKinney residents 25 years of age or older had a bachelor's degree or higher. The unemployment rate in July 2013 was 6.4 percent, which was lower than the statewide rate of 6.7 percent.<sup>50</sup>

At Elliott Elementary, nearly 62 percent of the school's 506 students in 2013 were white, with less than 16 percent Hispanic, almost 12 percent African American, and nearly 8 percent Asian. Less than 15 percent of students were economically disadvantaged.

Many parent reviews of Elliott Elementary comment on the nurturing atmosphere at the school. One typical review said:

This is the most wonderful and spirited school I have ever seen. I love the morning drop off routine, the staff helping, and even the "almost late" music. The environment is loving and affirming. Teachers are smiling and all seem to love what they do. Thank you for making my child feel loved each day. She loves learning and school.<sup>51</sup>

While the school personnel may be "loving and affirming," there is less to love when it comes to the school's test results and how the school compares to schools with similar student income-status demographics.

On the 2013 third-grade STAAR reading exam, 57 percent of Elliott students met or exceeded the proficient level, based on the Recommended Level II benchmark, meaning that 43 percent failed to meet or exceed proficiency, which is a percentage that is about three times the percentage of low-income students at the school. On the scatterplot graph for the STAAR third-grade reading exam, Elliott Elementary was located 4 percentage points below the regression line, which is the average performance of schools with the same-student-income-status demographic.

On the third-grade STAAR math exam, nearly 46 percent of Elliott students met or exceeded the Recommended Level II proficient level. On the scatterplot graph for the third-grade STAAR math exam, Elliott Elementary was located 3.2 percentage points below the regression line.

On the fourth-grade STAAR reading exam, 51 percent of Elliott students met or exceeded the Recommended Level II proficient level. For the fourth-grade STAAR reading exam, Elliott was located 9.7 percentage points below the regression line.

On the fourth-grade STAAR math exam, nearly 45 percent of Elliott students met or exceeded the Recommended Level II proficient level. Elliott was located 4.6 percentage points below the regression line.

On the fifth-grade STAAR reading exam, 57 percent of Elliott students met or exceeded the Recommended Level II proficient level. Elliott was located 6.7 percentage points below the regression line.

On the fifth-grade STAAR math exam, less than 53 percent of Elliott students met or exceeded the Recommended Level II proficient level. Elliott was located 7.2 percentage points below the regression line.

In all, Elliott Elementary School, which is a K-5 school, fell below the regression line on all six of the different STAAR grade-level reading and math exams.

Haslet Elementary School is located in the city of Haslet, which is in Denton County. Haslet is 15 miles north of Fort Worth and 20 miles south of Denton. The city has been listed as one of the top areas in the country for economic growth. In 2012, the city's population was 1,567, with 60 percent classified as urban and 40 percent listed as rural. The population had increased by more than 38 percent from 2000 to 2012.

The median household income in Haslet in 2013 was \$91,023, which was significantly higher than the statewide median of \$50,740. Haslet's median house/condominium value in 2013 was \$273,169, which was more than double the statewide median of \$129,200.<sup>52</sup>

Thirty percent of Haslet residents 25 years of age or older had a bachelor's degree or higher. The unemployment rate in July 2013 was 6.3 percent, which was lower than the statewide rate of 6.7 percent.<sup>53</sup>

At Haslet Elementary, nearly 83 percent of the school's 483 students in 2013 were white, with less than 11 percent Hispanic. Less than 10 percent of students were economically disadvantaged.

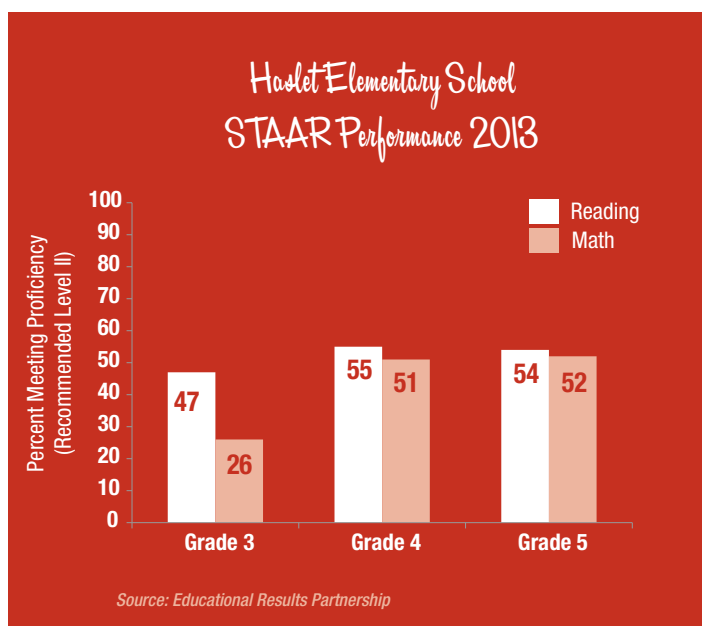

On the 2013 third-grade STAAR reading exam, 47 percent of Haslet students met or exceeded the proficient level, based on the Recommended Level II benchmark, meaning that 53 percent failed to meet or exceed proficiency, which is a percentage that is more than five times the percentage of low-income students at the school. On the scatterplot graph for the STAAR third-grade reading exam, Elliott Elementary was located 16.6 percentage points below the regression line, which is the average performance of schools with the same-student-income-status demographic.

On the third-grade STAAR math exam, 26 percent of Haslet students met or exceeded the Recommended Level II proficient level. On the scatterplot graph for the third grade STAAR math exam, Haslet Elementary was located 24.7 percentage points below the regression line.

On the fourth-grade STAAR reading exam, less than 55 percent of Haslet students met or exceeded the Recommended Level II proficient level. For the fourth-grade STAAR reading exam, Haslet was located 8.7 percentage points below the regression line.

On the fourth-grade STAAR math exam, less than 51 percent of Haslet students met or exceeded the Recommended Level II proficient level. Haslet was located 0.8 percentage points below the regression line.

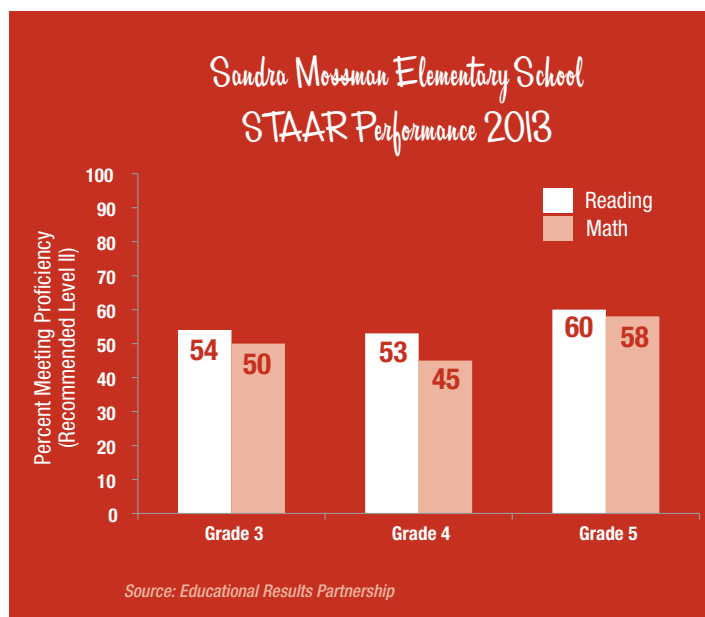

On the fifth-grade STAAR reading exam, 54 percent of Haslet students met or exceeded the Recommended Level II proficient level. Haslet was located 12.2 percentage points below the regression line.

On the fifth-grade STAAR math exam, 52 percent of Haslet students met or exceeded the Recommended Level II proficient level. Haslet was located 9.7 percentage points below the regression line.

In all, Haslet Elementary School, which is a K-5 school, fell below the regression line on all six of the different STAAR grade-level reading and math exams.

Sandra Mossman Elementary School is located in League City, parts of which are in Galveston and Harris counties. League City is 25 miles outside of Houston. In the early 2000's, League City had surpassed Galveston as the largest city in Galveston County. In 2013, one financial website named League City as the best city in Texas for job hunters.<sup>54</sup> In 2012, the city's population was 88,188. The population had increased by more than 94 percent from 2000 to 2012.

The median household income in League City in 2013 was \$81,046, which was significantly higher than the statewide median of \$50,740. League City's median house/condominium value in 2013 was \$161,800, which was more pricey than the statewide median of \$129,200.<sup>55</sup>

Forty percent of League City residents 25 years of age or older had a bachelor's degree or higher. The unemployment rate in July 2013 was 5.6 percent, which was lower than the statewide rate of 6.7 percent.<sup>56</sup>

At Sandra Mossman Elementary, nearly 67 percent, or two-thirds of the school's 772 students in 2013 were white, with less than 18 percent Hispanic, 7 percent African

American, and 6 percent Asian. Less than 15 percent of students were economically disadvantaged.

Parent reviews of the Sandra Mossman are mixed. One parent said that "kids feel loved and they love the school as well." However, another parent sharply condemned the academics and lax grading at the school:

Teachers give fake grades (no one makes less than a 70) even when in reality they have not mastered skills. How can a child fail a state basic skills assessment but hold a 90 average in math?? The state only requires a student to pass with a 43%. When we asked this question of administrators we were not given a straightforward answer.<sup>57</sup>

The latter parent makes the critical point that, under the Phase 1 Level II proficiency benchmark, the state of Texas does not require a high level of performance for a student to pass the STAAR exams. In-class grades may lie, but using the Recommended Level II benchmark, it is apparent that many Sandra Mossman students come up short.

On the 2013 third-grade STAAR reading exam, 54 percent of Sandra Mossman students met or exceeded the proficient level, based on the Recommended Level II benchmark, meaning that 46 percent failed to meet or exceed proficiency, which is a percentage that is more than three times the percentage

of low-income students at the school. On the scatterplot graph for the STAAR third-grade reading exam, Sandra Mossman Elementary was located 6.8 percentage points below the regression line, which is the average performance of schools with the same-student-income-status demographic.

On the third-grade STAAR math exam, 50 percent of Sandra Mossman students met or exceeded the Recommended Level II proficient level. Despite the fact that half of the school's third graders failed to achieve Recommended Level II proficiency, on the scatterplot graph for the third grade STAAR math exam, Sandra Mossman Elementary was located 0.9 percentage points *above* the regression line.

On the fourth-grade STAAR reading exam, 53 percent of Sandra Mossman students met or exceeded the Recommended Level II proficient level. For the fourth-grade STAAR reading exam, Sandra Mossman Elementary was located 7.9 percentage points below the regression line.

On the fourth-grade STAAR math exam, less than 45 percent of Sandra Mossman students met or exceeded the Recommended Level II proficient level. Sandra Mossman Elementary was located 4.8 percentage points below the regression line.

On the fifth-grade STAAR reading exam, less than 60 percent of Sandra Mossman students met or exceeded the Recommended Level II proficient level. Sandra Mossman Elementary was located 4.3 percentage points below the regression line.

On the fifth-grade STAAR math exam, less than 58 percent of Sandra Mossman students met or exceeded the Recommended Level II proficient level. Sandra Mossman Elementary was located 2.1 percentage points below the regression line.

In all, Sandra Mossman Elementary School, which is a K-5 school, fell below the regression line on five different STAAR grade-level reading and math exams, and in the one grade-level exam where the school was above the regression line -- third-grade math -- 50 percent of students in that grade level failed to meet or exceed final Recommended Level II proficiency.

Laura Negley Elementary School is located in the city of Kyle, which is in Hays County. Kyle is 23 miles outside of Austin. The city has been listed as one of the fastest growing cities in Texas. Indeed, in 2012, the city's population was 30,875. The population had increased by a whopping 481 percent from 2000 to 2012.

The median household income in Kyle in 2013 was \$68,660, which was significantly higher than the statewide median of \$50,740. Kyle's median house/condominium value in 2013 was \$149,409, which was higher than the statewide median of \$129,200.<sup>58</sup>

A quarter of Kyle's residents 25 years of age or older had a bachelor's degree or higher. The unemployment rate in July 2013 was 4.4 percent, which was significantly lower than the statewide rate of 6.7 percent.<sup>59</sup>

*On the fourth-grade  
STAAR math exam, less  
than 45 percent of  
Sandra Mossman students  
met or exceeded the  
Recommended Level II  
proficient level.*

At Laura Negley Elementary, nearly 64 percent of the school's 766 students in 2013 were white, with less than 31 percent Hispanic. Less than 15 percent of students were economically disadvantaged.

Recent parent reviews of Laura Negley Elementary are mixed. One parent loved the school's teachers "because they care." In stark contrast, however, another parent wrote:

Parent involvement is high with fundraising events and a specific grade level event/performance, but not within the classroom. The quality of teachers is POOR. My children have attended this school since Kindergarten and have continually slipped through the cracks academically. They are not part of any at-risk sub-pop, nor learning disabled, but have never made adequate yearly progress according to the State. When I have made attempts to contact their teachers to understand my children's specific needs, there is no response. Where is the state mandated compensatory education? How are students selected to receive support? When does the support take place? How are the teachers being monitored, shown support (high number of beginning teachers), and held accountable for student growth? Every student is capable of learning. It's not like this school is lacking funds or resources. When are the teachers going to start teaching?<sup>60</sup>

It is important to underscore that the latter parent says that his/her child does not come from an at-risk population, but is, nevertheless, having academic problems at the school. Indeed, based on Recommended Level II STAAR results, many students at Laura Negley are slipping through the academic cracks.

On the 2013 third-grade STAAR reading exam, 45 percent of Laura Negley students met or exceeded the proficient level, based on the Recommended Level II benchmark, meaning that 55 percent failed to meet or exceed proficiency, which is a percentage that is three-and-two-thirds times the percentage of low-income students at the school. On the scatterplot graph for the STAAR third-grade reading exam, Laura Negley Elementary was located 16.1 percentage points below the regression line, which is the average performance of schools with the same-student-income-status demographic.

On the third-grade STAAR math exam, 32 percent of Laura Negley students met or exceeded the Recommended Level II proficient level. On the scatterplot graph for the third grade STAAR math exam, Laura Negley Elementary was located 16.9 percentage points below the regression line.

On the fourth-grade STAAR reading exam, less than 49 percent of Laura Negley students met or exceeded the Recommended Level II proficient level. For the fourth-grade STAAR reading exam, Laura Negley Elementary was located 12 percentage points below the regression line.

On the fourth-grade STAAR math exam, 39 percent of Laura Negley students met or exceeded the Recommended Level II proficient level. Haslet was located 10.3 percentage points below the regression line.

On the fifth-grade STAAR reading exam, 52 percent of Laura Negley students met or exceeded the Recommended Level II proficient level. Laura Negley Elementary was located 11.5 percentage points below the regression line.

On the fifth-grade STAAR math exam, 36 percent of Laura Negley students met or exceeded the Recommended Level II proficient level. Laura Negley was located 23.6 percentage points below the regression line.

In all, Laura Negley Elementary School, which is a K-5 school, fell below the regression line on all six of the different STAAR grade-level reading and math exams.

Lumberton High School is located in the city of Lumberton, which is the largest city in Hardin County. Lumberton is 13 miles from Beaumont and 80 miles from Houston. Considered a bedroom community, Lumberton is one of the fastest growing towns in Texas, with numerous new subdivisions. In 2012, the town's population was 12,061, a 38 percent increase from 2000 to 2012.

The median household income in Lumberton in 2013 was \$64,401, which was higher than the statewide median of \$50,740. Lumberton's median house/condominium value in 2013 was \$150,397, which was higher than the statewide median of \$129,200.<sup>61</sup>

Twenty-two percent of Lumberton's residents 25 years of age or older had a bachelor's degree or higher. The unemployment rate in July 2013 was 8.5 percent, which was higher than the statewide rate of 6.7 percent.<sup>62</sup>

At Lumberton High, 91 percent of the school's 1,101 students in 2013 were white, with less than 8 percent Hispanic. Twenty-one percent of students were economically disadvantaged.

Combining the results for the end-of-course 2013 STAAR reading exams at Lumberton High, 54 percent of the school's students met or exceeded the proficient level, based on the Recommended Level II benchmark, meaning that 46 percent failed to meet or exceed proficiency, which is a percentage that is more than double the percentage of low-income students at the school. On the scatterplot graph for the combined STAAR end-of-course reading exams, Lumberton was located 6.8 percentage points below the regression line, which is the average performance of schools with the same-student-income-status demographic.

On the end-of-course 2013 STAAR math exams (algebra I, geometry and algebra II), a combined 42 percent of the Lumberton High's students met or exceeded the proficient level, based on the Recommended Level II benchmark, meaning that 58 percent failed to meet or exceed proficiency. On the scatterplot graph for the combined STAAR end-of-course reading exams, Lumberton was located 3.8 percentage points below the regression line, which is the average performance of schools with the same-student-income-status demographic.

It is important to emphasize that comparing a school's performance vis-à-vis the regression line has a limitation. The regression line is not an independently judged ideal benchmark of school and student performance. Rather, it is an expression of the performance average based on the performance of all regular public schools in the state.

If many schools do not perform highly, then the regression line is not set very high. The fact that 46 percent of Lumberton High School's students could fail to achieve Recommended Level II proficiency on end-of-the-course STAAR reading exams, and yet the school was still only 6.8 percentage points below the regression line indicates that other schools with similar percentages of low-income students are not performing well on end-of-course English language arts. Indeed, even if a school met average performance, as represented by the regression line, there would still be much room for improvement.

Still, the regression line is useful in exposing school underperformance that would have been missed by using the 33/50 evaluation criteria alone. What the regression-line analysis does not catch are schools somewhat above the regression line, but which one could still argue are having performance issues. Take, for example, Pink Elementary School.

Located in the affluent city of Frisco, which is in Collin County and part of the Dallas metro area, Pink Elementary had 710 students in 2013. The school's population was 74 percent white, less than 10 percent Hispanic, and 9 percent Asian. Only 1.3 percent of the students were economically disadvantaged.

On the 2013 fourth-grade STAAR math exam, less than 65 percent of Pink Elementary students met or exceeded Recommended Level II proficiency, meaning that more than 35 percent did not, which was a percentage 27 times the percentage of economically disadvantaged students at the school. Yet, on the scatterplot graph for the STAAR fourth-grade reading exam, Pink Elementary was located 10.3 percentage points *above* the regression line, which is the average performance of schools with the same-student-income-status demographic. Pink Elementary School had similar relatively unimpressive Recommended Level II proficiency percentages in all other grade-level math and reading exams, but none resulted in positions below the respective regression lines.

Pink Elementary School's example demonstrates the limitation of the regression-line analysis. Still, in a positive sense, one can say that the regression-line analysis is a conservative tool, which likely under-includes rather than over-includes schools that have performance problems.

## Higher Performing Texas Public Schools

While this paper has focused on regular public schools that are "not as good as you think," it is instructive to point out that there are schools with predominantly non-low-income students that are higher performing, especially in comparison to nearby schools.

Take two schools in the Lewisville Independent School District. Tom Hicks Elementary School is situated in Frisco, while Wellington Elementary School is located in the city of Flower Mound. Both these affluent cities have been described earlier in this study.

Tom Hicks and Wellington have very similar demographics. Both schools have just less than 4 percent of their student populations categorized as economically disadvantaged. At Tom Hicks, 65 percent of students are white, 13 percent are Asian, and less than 12 percent are Hispanic. At Wellington, 66 percent of students are white, 21 percent are Asian, and 8 percent are Hispanic. Yet, despite these similarities, the STAAR results at the two schools are very different.

On the third-grade STAAR reading exam, 58 percent of Tom Hicks students met or exceeded Recommended Level II proficiency. In contrast, 82 percent of Wellington students met or exceeded Recommended Level II proficiency.

On the third-grade STAAR math exam, less than 50 percent of Tom Hicks students met or exceeded Recommended Level II proficiency. At Wellington, nearly 66 percent of students met or exceeded Recommended Level II proficiency.

On the fourth-grade STAAR reading exam, 50 percent of Tom Hicks students met or exceeded Recommended Level II proficiency. In contrast, 73 percent of Wellington students met or exceeded Recommended Level II proficiency.

On the fourth-grade STAAR math exam, less than 29 percent of Tom Hicks students met or exceeded Recommended Level II proficiency. At Wellington, nearly 58 percent of students met or exceeded Recommended Level II proficiency.

On the fifth-grade STAAR reading exam, 65 percent of Tom Hicks students met or exceeded Recommended Level II proficiency. In contrast, almost 75 percent of Wellington students met or exceeded Recommended Level II proficiency.

On the fifth-grade STAAR math exam, less than 63 percent of Tom Hicks students met or exceeded Recommended Level II proficiency. At Wellington, nearly 75 percent of students met or exceeded Recommended Level II proficiency.

Thus, while there is certainly room for improvement at Wellington Elementary, the school compares favorably to a similarly populated school like Tom Hicks Elementary, both of which are in the same school district.

Despite the fact that Wellington Elementary has higher scores relative to Tom Hicks Elementary, it is important to point out that Wellington's scores still leave something to be desired. For example, although Wellington has only 4 percent of its students categorized as economically disadvantaged, 42 percent of its fourth graders failed to perform at or above Recommended Level II proficiency on the STAAR math exam, which is a percentage ten times the percentage of disadvantaged students at the school. Thus, even "better" schools are still not great.

Also, even though Wellington scores are relatively better than those at Tom Hicks, what does that mean for parents at Tom Hicks? If Tom Hicks is their neighborhood school then that is where their children will go. Wellington's higher performance is merely an academic point. Further, since there are no meaningful incentives, such as competition for students in the face of a universal school-choice program, for individual schools in the public-school system to copy better practices at other public schools, there is little hope that the traits of higher performing public schools will be mimicked by lower performing schools.

# Conclusions and Recommendations

What this paper has shown is that many Texas schools with predominantly non-low-income student populations have significant quality and performance problems. These quality and performance issues can be seen using a variety of measurements.

On the NAEP exams, large proportions of non-low-income Texas students fail to perform at the proficient level. Also, Texas trails high-performing states like Massachusetts in the proportion of non-low-income students performing at proficiency on the NAEP.

Using the Recommended Level II proficiency cut-points for the STAAR exam, of the 1,115 regular public schools in Texas that have 33 percent or fewer of their students designated as low income, 673, or 60 percent, have at least one grade where 50 percent or more of students in that grade level failed to meet or exceed the proficient level on either the state reading or math test.

Further, using the Recommended Level II cut-points and simple linear regression modeling, out of 1,115 schools with 33 percent or fewer of their students categorized as low income, 758, or 68 percent, had at least one grade where students performed below average on a STAAR subject-matter test.

These results should cause non-low-income Texas parents, many of whom are middle class, to re-think their views on the quality of their neighborhood public schools, and, consequently, to open their minds to other education options, choices, and policy changes that would allow their children to escape underperforming schools and attend better-performing alternatives. Indeed, parents quoted in this study complained about the poor academics for their non-at-risk children at their predominantly non-low-income schools.

It is no secret that many middle-class parents decide to locate to certain neighborhoods because they think that the local public schools are high performing and will benefit their children. Former Harvard Law professor and current U.S. Senator Elizabeth Warren and her daughter Amelia Warren Tyagi have written that the major reason middle-class families are willing to shell out so much of their incomes on housing is that “when a family buys a house, it buys much more than shelter from rain”; rather, it “buys a public-school system.” They note, “For most middle-class parents, ensuring that their children get a decent education means buying a home in a small subset of well-reputed school districts.”

Warren and Tyagi advise: “Any policy that loosens the ironclad relationship between location-location and school-school-school would eliminate the need for parents to pay an inflated price for a home just because it happens to lie with the boundaries of a desirable school district.”<sup>63</sup> Such a policy would “relieve parents from the terrible choice of leaving their kids in lousy schools or bankrupting themselves to escape those schools.”<sup>64</sup>

Toby Young, who has written a book on free schools, which are the British version of U.S. charter schools, has pointed out that many middle-class schools in Britain are underperforming. Yet, in many areas in Britain, like in Texas, there is only one government-run public school for miles around “so the only choice is to plump for the local school or go private.”<sup>65</sup> Given the cost of private education, Young says:

For middle-income or low-income families, that isn't any choice at all. It's the lack of any competition that enables these "sink" middle-class schools to "muddle through." After all, the vast majority of parents in the surrounding areas will have no choice but to send their children to these schools, regardless of how poorly they perform.<sup>66</sup>

For middle-class parents, who have gone into debt to buy into "good" neighborhoods with "good" public schools, what are they to do when they find out that the schools are not as good as they thought they were? The answer is to consider and support school-choice programs that are not just targeted at small groups of low-income families, but that give parents of all or most income levels the ability to choose the public or private school that best meets the needs of their children.

For besieged middle-class parents, Warren and Tyagi recommended, "A well-designed voucher program would fit the bill neatly."<sup>67</sup>

Indiana has enacted its Choice Scholarship Program, which makes school-choice scholarships available to many non-low-income parents. In addition to students who qualify for the National School Lunch Program, who are eligible for a voucher worth up to 90 percent of the state per-pupil spending amount for the sending district, students "from families earning 150 percent of that same threshold can receive a voucher worth up to 50 percent of the state funding allocation for the sending district."<sup>68</sup> Parents can use the state-funded voucher to pay for private-school tuition.

It is estimated that 42 percent of Indiana families meet the eligibility requirements of the Indiana program. While the Indiana program is an improvement over other school-choice programs that focus exclusively on low-income families, the Friedman Foundation for Educational Choice says, "the income eligibility level [for the Indiana program] is too low for higher income families to participate."<sup>69</sup>

Although it has a charter school law, Texas has no school-choice program that involves private schools. While lawmakers in Austin have clashed over school choice, Texans strongly support private school-choice options.

A 2013 poll by The Friedman Foundation for Educational Choice and the Texas Public Policy Foundation found that a large majority of Texas voters, 66 percent, support school vouchers, which allow parents to use their children's public education funds for private school tuition. Commenting on the poll results, Robert Enlow, president and CEO of The Friedman Foundation, said. "Texas voters want a great education for their kids and the freedom to choose the schools that work best for them. They deserve, and want, more than what the status quo has to offer."<sup>70</sup>

When asked by a Texas legislative committee why STAAR scores have not gone up, a Texas Education Agency official replied, "That might more correctly be directed to [local] school people." *The Dallas Morning News* observed that if Texas education officials are "right that the problem is in teaching, it's an issue for just about every classroom in Texas."<sup>71</sup> In fact, Texans have figured out that there are problems going on in too many classrooms across the state, and they are not happy about it.

The Friedman Foundation/Texas Public Policy Foundation poll found that many Texas voters were dissatisfied with the education status quo:

As for the quality of K-12 education in the state, 55 percent of voters said it is on the “wrong track” whereas 33 percent see it moving in the “right direction.” A similar percentage, 54 percent, labeled the state’s public school system as “fair” or “poor,” with 42 percent identifying it as “good” or “excellent.”<sup>72</sup>

“Texans believe that every child should have a chance to attend a school that best addresses their specific needs,” Brooke Rollins, president and CEO of the Texas Public Policy Foundation, said. “Even an excellent public school may not be the best fit for addressing the needs of every student in its district. Unfortunately, Texas’ education system provides too few opportunities for families seeking alternatives to their local public school.”<sup>73</sup> As this study has shown, however, many supposedly “excellent” public schools are not as good as people think, which is even more reason to provide school-choice alternatives for all Texas parents and their children.

Texas should therefore consider programs such as Indiana’s and those in other states that make scholarships available to middle-class parents.

Increased choice for parents of all incomes, therefore, should be the guiding principle for Texas policymakers. Too many children in Texas, including many from middle-class families, are going to underperforming schools. They have an inherent right to be able to attend a better school, whether public or private.

Major school-choice proposals have made some headway in the Texas legislature at the committee level, but none have been enacted into law. The inability of lawmakers to address the clear preference of Texas voters on school choice is unacceptable. As Robert Enlow and Brooke Rollins point out:

Today, the default in Texas is that parents’ ZIP codes determine the schools where they must send their kids. That’s why nearly 93 percent of students are in traditional public schools—regardless of those schools’ quality—and only 3 percent are able to choose charter schools and just 4 percent are able to access private schools.

However, according to our survey, if voters could select any type of school to obtain the best education for their children, just 34 percent would choose traditional public schools, whereas 47 percent would select private schools, 8 percent would opt for charters, and 8 percent would home school their kids.<sup>76</sup>

The dithering in Austin clearly frustrates parents who want to act on their preferences. One Texas parent complained, “My kids need options now, not in two or four more years.”<sup>77</sup> Indeed all parents in Texas and in other states should have the immediate power to choose the school that best meets the needs of their children. Commenting on his own country’s universal school-choice voucher program, the late Swedish education minister Per Unckel has said:

Kids should never ever have to stay in a school if the school is lousy. The right of the kid is to get a good education. If the public sector cannot offer it, he or she should have the right to go somewhere else.<sup>78</sup>

Appendix B  
Texas Non-Low-Income  
Schools Performance

# HOW TO READ THE TABLES

## **% Low-Income**

The percentage of economically disadvantaged students in the school. The study only includes schools in which 33 percent or fewer of the students qualify for the National School Lunch Program (NSLP).

## **ELA Prof. Less than 50%/Math Prof. Less than 50%**

The number of grades in the school in which 50 percent or more of the students scored less than proficient (Recommended Level II-Satisfactory Academic Performance) on the State of Texas Assessments of Academic Readiness (STAAR) in English language arts/reading or math.

## **ELA Prof. Below LR/Math Prof. Below LR**

A technique called linear regression-line modeling (LR in the tables) was used to show a relationship between the percentage of students in a school who are classified as low-income and the percentage of students who score proficient (Recommended Level II-Satisfactory Academic Performance) or above on the State of Texas Assessments of Academic Readiness (STAAR) in English language arts (ELA) or math for a particular grade level. This analysis for each grade in ELA/reading and math allows for the identification of schools that are performing above or below average performance based on the performance of all the other schools in the state. This column shows the number of grades at that school that were below the average performance of all other schools with the same percentage of low-income students.

## **% ELA Prof./% Math Prof.**

The percentage of students that scored proficient (Recommended Level II-Satisfactory Academic Performance) or above on the State of Texas Assessments of Academic Readiness (STAAR) in English-language-arts/reading or math.

## **ELA LR Gap/Math LR Gap**

A technique called linear regression modeling (LR in the tables) was used to estimate whether a relationship exists between the percentage of students in a school who are classified as low-income and the percentage of students who score proficient (Recommended Level II-Satisfactory Academic Performance) or above on the State of Texas Assessments of Academic Readiness (STAAR) in English language arts/reading or math. This column shows the percentage points above or below the average (the linear regression line) for that grade based on the percentage of students who are low-income and the percentage of students who scored proficient or higher. A positive number means that the school is performing above the average and a negative number means that the school is performing below average. The higher or lower the percentage, the larger the gap from the average.

## **Green Bar Indicates Schools that have No Grades with Less than 50% Proficiency and No Negative Positions Below ELA/Math Regression Lines**

28 “Texas’ STAAR scores show little improvement for third year,” *The Dallas Morning News*, May 29, 2014.

29 For our analysis, we utilized the “STAAR Campus Level Files” available on the Texas Education Agency (TEA) web site at <http://ritter.tea.state.tx.us/student.assessment/reporting/staaragg/dnload.html>. We utilized both the Phase I and Final (Recommended) cut points in comparing results. In order to create the high school level aggregates, we aggregated the results from the Reading 1, Reading 2 and

Reading 3 assessments as our language arts measure and the Algebra I, Geometry and Algebra II End of Course Assessments as our mathematics measure. For poverty data, we utilized the publicly available data from TEA's web site. For campuses where poverty data wasn't available in the TEA dataset, we estimated poverty based on the percentage of those students tested in the STAAR data. In preparing for our analysis, we identified two possible sources of STAAR results, the "STAAR Campus Level Files" which we utilized as well as the Texas Academic Performance Report (TAPR) data available at <http://ritter.tea.state.tx.us/perfreport/tapr/2013/download/DownloadData.html>. In comparing the two sources, it appeared the number of students proficient on the assessment matched closely between the sources, however the number of students included and the resulting proficiency rate varied between the data files. TEA's explanation for the differences was that "[t]he assessment files used for determining accountability ratings have inclusions and exclusions not shown on the raw files." The "STAAR Campus Level Files" seemed to provide generally higher rates of proficiency and appeared to be the simpler measure for the public to understand, so we took a conservative approach and utilized it for our analysis.

# ABOUT THE AUTHORS

## LANCE T. IZUMI, J.D.

Lance Izumi is Koret Senior Fellow and Senior Director of Education Studies at the Pacific Research Institute. He is the author of the highly praised 2012 book *Obama's Education Takeover* (Encounter Books), which details the centralization of education policymaking in Washington under President Obama. His most recent work is the 2013 PRI report, "One World School House vs. Old World Statehouse: The Khan Academy and California Red Tape."

He is the co-author of the 2011 PRI book *Short-Circuited: The Challenges Facing the Online Learning Revolution in California* and is the executive producer and narrator of a *National Review* Online-posted short film based on the book.

Lance is also the co-author of the groundbreaking book *Not as Good as You Think: Why the Middle Class Needs School Choice* and co-executive producer of the award-winning 2009 PBS-broadcast film documentary *Not as Good As You Think: The Myth of the Middle Class School*. He also appears in Academy Award-winning director Davis Guggenheim's 2010 education film documentary *Waiting for Superman*, which was voted best U.S. documentary at the prestigious Sundance Film Festival.

In 2008, *The New York Times* selected Lance Izumi to be one of its online contributors on the presidential race and education issues. In 2009, *The New York Times* posted *Sweden's Choice*, a short film on Sweden's universal school-choice voucher system, which he wrote and narrated. Mr. Izumi continues to contribute to *The New York Times*' "Room for Debate" opinion series.

He is also the co-author of the 2005 PRI book *Free to Learn: Lessons from Model Charter Schools*, which was used as a guidebook for creating high-performing charter schools in New Orleans after Hurricane Katrina. He has also authored numerous PRI studies and reports, plus innumerable op-ed pieces in top U.S. and international publications.

Mr. Izumi is a member of the Board of Governors of the California Community Colleges, the largest system of higher education in the nation. First appointed to the Board in 2004, he is now the Board's longest serving member. He served two terms as president of the Board of Governors from 2008 through 2009.

Mr. Izumi served as chief speechwriter and director of writing and research for California Governor George Deukmejian. He also served in the administration of President Ronald Reagan as speechwriter to United States Attorney General Edwin Meese III.

*(Izumi continued)*

Mr. Izumi received his juris doctorate from the University of Southern California School of Law. He received his master of arts in political science from the University of California at Davis and his bachelor of arts in economics and history from the University of California at Los Angeles.

### **ALICIA CHANG, Ph.D.**

Alicia Chang is a cognitive and developmental psychologist (Ph.D., UCLA), specializing in cognitive and language development and applications of cognitive science to STEM education. Since completing her doctorate and postdoctoral research fellowships at the University of Pittsburgh and the University of Delaware, Alicia has been working in the field of education technology. She lives and works in the San Francisco Bay Area, and serves as a researcher at the Pacific Research Institute.

# ABOUT PRI

The Pacific Research Institute (PRI) champions freedom, opportunity, and personal responsibility by advancing free-market policy solutions. It provides practical solutions for the policy issues that impact the daily lives of all Americans, and demonstrates why the free market is more effective than the government at providing the important results we all seek: good schools, quality health care, a clean environment, and a robust economy.

Founded in 1979 and based in San Francisco, PRI is a non-profit, non-partisan organization supported by private contributions. Its activities include publications, public events, media commentary, community leadership, legislative testimony, and academic outreach.

## **Education Studies**

PRI works to restore to all parents the basic right to choose the best educational opportunities for their children. Through research and grassroots outreach, PRI promotes parental choice in education, high academic standards, teacher quality, charter schools, and school-finance reform.

## **Business and Economic Studies**

PRI shows how the entrepreneurial spirit—the engine of economic growth and opportunity—is stifled by onerous taxes, regulations, and lawsuits. It advances policy reforms that promote a robust economy, consumer choice, and innovation.

## **Health Care Studies**

PRI demonstrates why a single-payer Canadian model would be detrimental to the health care of all Americans. It proposes market-based reforms that would improve affordability, access, quality, and consumer choice.

## **Environmental Studies**

PRI reveals the dramatic and long-term trend toward a cleaner, healthier environment. It also examines and promotes the essential ingredients for abundant resources and environmental quality: property rights, markets, local action, and private initiative.

## **The Laffer Center at Pacific Research Institute**

Founded in 2012, The Laffer Center at the Pacific Research Institute is dedicated to preserving and promoting the core tenets of supply-side economics. The Laffer Center is named after Arthur B. Laffer, one of the nation's leading economic minds and considered by many to be the "Father of Supply-Side Economics." The Laffer Center houses Dr. Laffer's life's work and seeks to be the leading source for supply-side research and thought.
